To manage this setting: Excel 2010/2013: As shown in Figure 2, choose File, Options, and then enable the Show Sheet Tabs setting in the Display Options section of the Advanced options. In Excel 2010 and earlier, it's relatively easy to inadvertently arrange a spreadsheet window so that the worksheet tabs aren't present on the screen, even if the Show Sheet Tabs option is enabled. Excel 2011 for Mac: From the main menu, choose Format, Sheet, and then Unhide. One of the best parts of Excel is the multiple functions available. Contact David at or follow him on Twitter. Excel 2007: Click the Office button, choose Excel Options, and then then enable the Show Sheet Tabs setting in the Display Options section of the Advanced options. Regardless of whether you can see the actual tabs, you can use a keyboard shortcut to navigate between worksheets within a workbook. David speaks at conferences about Microsoft Excel, and presents webcasts for several CPE providers, including AccountingWEB partner CPE Link. Now you need to know the number of the price column, for this example, say it's column 5. Here is the process to use VLOOKUP in Excel.Functions Within ExcelExcel offers users many functions to assess data to make determinations regarding the data quickly. If this happens, your "missing" worksheets may be hiding in plain sight due to a simple Excel setting. In other cases, your worksheet tabs may be present, but a worksheet still appears to be missing. If the Unhide sheet is disabled, you can't necessarily assume that there are no hidden worksheets within a workbook. In addition to restoring vanished worksheet tabs, I'll also describe a couple of techniques for navigating workbooks easier, as well as other ways to find hidden worksheets. Another scenario you may encounter is shown in Figure 3. If this occurs, as shown in the figure, you can double-click on the workbook's name to maximize the window and restore your workbook tabs. Savvy users rely on a little-known xlSheetVeryHidden setting to hide worksheets in plain sight. The VLOOKUP is used to retrieve and lookup specific data within a column. A popular and handy function within Excel is the ability to find specific data in a large range.The VLOOKUP function is a highly useful function, especially when dealing with a lot of data. Excel 2011 for Mac: Choose Excel, Preferences, View, and then Show Sheet Tabs. You can find the sum or average of a set of data. Excel 2013 offers some helpful improvements to this Activate menu, as all worksheets are displayed in a single dialog box, and you can select a worksheet by typing the first letter of a sheet name. Excel 2003 and earlier: Choose Tools, Options, Display, and then Show Sheet Tabs. In Excel 2010 and earlier, the Activate menu initially displays up to 16 worksheets, requiring you to choose More Sheets to display an expanded list. So, in this case, you would want to make sure the column with the part number is located to the left of the price column. It also allows users to create sheets of large data and use that data in calculations to create reports. Excel 2003 and earlier: Choose Format, Sheet, and then Unhide. The spreadsheet may have thousands of entries so the VLOOKUP will find the price when you input the proper parameters easily.Tips to Use VLOOKUPTo use VLOOKUP properly, it's important to make sure that the value you want to look up is situated left to the return value you want to find. Typically, within an Excel workbook you'll see worksheet tabs along the bottom of the screen, but it's also possible to hide the worksheet tabs, as shown in Figure 1. MORE FROM QUESTIONSANSWERED.NET Further, in Excel 2010 and earlier you must choose a desired sheet name with your mouse, as the menu cannot be accessed by way of keystrokes as is possible in Excel 2013. If your columns are not organized in this manner, you can move your column.What You Need for the VLOOKUP FormulaTo use the VLOOKUP function, you need the value you want to look up, the range you want to search and the column number within that range that includes what you're looking to find.Using the VLOOKUP FunctionNow, in the column to the right of all of your fields, enter =VLOOKUP(lookup value, range, column number, TRUE/FALSE). If so, the first place to check is to see if the worksheet has been hidden. Figure 2: The Show Sheet Tabs setting determines whether or not worksheet tabs are visible. Assuming that the Show Sheet Tabs option is enabled, another way to navigate within a workbook is to right-click on the navigation arrows in the lower left-hand corner of the screen, as shown in Figure 4. A good example of using this function is trying to find the price of a specific part number on an inventory spreadsheet. Figure 4: Right-click on the navigation arrows in any version of Excel to display a list of worksheets. Read more articles by David Ringstrom. About the author: David H. In Excel 2013 if you can't see the worksheet tabs, simply double-click on the words "Microsoft Excel" at the top of the window to maximize Excel's application window. Microsoft Excel is spreadsheet software that allows users to organize data into graphs, pivot tables and charts. To do so, press Ctrl+Page Up to activate the adjacent worksheet to the left or press Ctrl+Page Down to activate the next worksheet to the right. The Format command on the Home tab of the ribbon doesn't allow you to unhide worksheets. Ringstrom, CPA heads up Accounting Advisors, Inc., an Atlanta-based software and database consulting firm providing training and consulting services nationwide. In Excel 2007 and later, you can right-click on any worksheet tab and choose Unhide. Figure 1: You may encounter workbooks where the worksheet tabs aren't visible. You can also access the Unhide Sheet command through Excel's main menu: Excel 2007 and later: On the Home tab, choose Format, Hide and Unhide, and then Unhide Sheet. Figure 3: Excel windows sometimes get arranged such that workbook tabs aren't visible. You can also sort data by columns or ranges. If the Unhide command is disabled, there most likely aren't any hidden worksheets in the workbook, but there's a way you can determine this categorically. For example, let's say the product you're looking for is in cell B2 and your range goes from B2 to H800. So now your formula looks like this =VLOOKUP(b2,b2:h800,5,TRUE). This will return the exact value of the price of the product found in cell B2. You want to use TRUE for an approximate match and FALSE for an exact match. This displays a hidden menu from which you can select any visible worksheet in the workbook. It can be disconcerting when you open an Excel workbook that has several worksheets, but you only see single worksheet. Now, find the product number you're looking for within the product number column.
